## DECLARATION

I, Navaratnarajah Sudesan, hereby declare that the content of this thesis is the output of original research work carried out at the Department of Civil Engineering, University of Moratuwa. Whenever the work done by others was used, it was mentioned appropriately as a reference.

[^0]

## ACKNOWLEDGEMENT

I am immensely grateful to my supervisor, Prof.M.T.R.Jayasinghe, Professor in Civil Engineering at the Department of Civil Engineering for his invaluable guidance and support throughout my research period which helped to make this research a successful one. He not only provided direction and guidance during this research study, but also encouraged me to really learn and understand structural Engineering.

I would like to thank all the other lecturers in the department of civil Engineering at the University of Moratuwa for the positive attitude they adopted in promoting this research project.

1 wish to thank Eng.Mr.Mangala Silva ,Director,Synergo Consultants (PVT)Ltd, for his valuable assistance provided to me to complete this research successfully.

I wish to acknowledge General Manager, Addl.GM (WSP) and DGM (PC) who helped me for sponsoring by National Water Supply \& Drainage Board and grant duty leave to attend the classes as per the scheduleUniversity of Moratuwa, Sri Lanka.

The assistance given by Mr. Husain attached to Synergo consultants (PVT) Itd is also appreciated.

Last but not least a special gratitude to my wife for bearing with me in making this study a success.

#### Abstract

Ground water reservoirs are commonly used in this country for storing 200 m 3 to 2000 m 3 water capacities when the area needed water supply having an elevated area (which elevation is sufficient for the head required)and this reservoir can be built on this. In Sri Lanka ground reservoirs are designed as per BS8007 and this design does not cover for earthquakes. However, it seems that no detail investigation has been carried out for response of these ground reservoirs for dynamic loads such as earthquakes.

This research work concentrates on detail dynamic analysis of existing cylindrical ground reservoirs. The results reflect that existing cylindrical ground reservoirs are not sufficiently adequate to withstand even minor earthquakes. This implies that they must be analyzed for earthquakes since their natural period of vibration give. high response for earthquakes which could even trigger structural failure ib. mrt.ac. 1 k

## CONTENTS

CHAPTER 1
Introduction
1.1 General ..... 1
1.2 Objectives ..... 3
1.3 Methodology ..... 3
1.4 Main Findings ..... 4
1.5 Arrangement of thesis ..... 4
CHAPTER 2
Literature Review
2.1 Introduction ..... 5
2.2 Spring mass model for seismic analysis ..... 7
2.3 Dynamic Model ..... 9
2.4 Response spectrum concept ..... 12
2.5 Dynamic Lateral Eorces and Total Base shear Lanka. ..... 14
2.6 Moments at Base ..... 19
2.7 Shear Transfef ${ }^{\text {Ctronic Theses \& Dissertations }}$ ..... 21
CHAPTER 3
Existing structures \& Computer Modeling
3.1 Existing structures ..... 24
3.2 Computer modeling ..... 24
3.2.1 Modeling for tank full, $86 \%$ fill, $65 \%$ fill, $43 \%$ fill and $22 \%$ fill Conditions
CHAPTER 4
Analysis of structures
4.1 Analysis of $650 \mathrm{~m}^{3}$ tank for full, $86 \%$ fill, $65 \%$ fill, $43 \%$ fill ..... 26 and $22 \%$ fill Conditions
4.1.1 Analysis for Earthquakes

## CHAPTER 5

Results
5.1 Introduction ..... 31
5.2 Ground reservoir with different water levels of storage ..... 31
5.3 Natural period of Vibration ..... 34
5.3 Comments on results ..... 35
CHAPTER 6
Conclusion \& Future works
6.1 Conclusions ..... 36
6.2 Future Works ..... 36
Referemees University of Moratuwa, Sri Lanka. Electronic Theses \& Dissertations www.lib.mrt.ac.lk
Annex 1
Modeling and Analysis of Tank for $100 \%$ of ..... 40
Water filling
Annex 2
Modeling and Analysis of Tank for $86 \%$, ..... 49
$65 \%, 43 \%, 22 \%$ of water filling
Annex 3
SAP Results of Computer Modeling for $100 \%, 86 \%, 65 \%$, ..... 69 $43 \%, 22 \%$ of water filling.

## List of Figures

Figure No 1.1 Photograph showing permanent deformation in a ..... 2 Water storage tank in Califonia
Figure No 2.1 Flexible, Non flexible base connections ..... 6

## NOTATIONS

$C_{c} C_{i} \quad=$ Period-dependent seismic response coefficients defined in 9.4 and 9.5 and $C_{t}$
$\mathrm{C}_{\mathrm{l}}, \mathrm{C}_{\mathrm{w}}=$ Coefficients for determining the fundamental frequency of the tank -liquid system 9refer to Eq.(9-24) and Fig.9.3.4 (b))
$\mathrm{D} \quad=$ Inside diameter of circular tank, $\mathrm{ft}(\mathrm{m})$
$h_{c} \quad=$ height above the base of the wall of to the centre of gravity of the case including base pressure (EBP), ft ( m )
$h_{i}^{\prime} \quad=$ height above the base of the wall to the centre of gravity of the convective lateral force for the case including base pressure (EBP), $\mathrm{ft}(\mathrm{m})$
$h_{i} \quad$ height above the base of the wall to the centre of gravity of the convective lateral force for the case including base pressure (EBP), $\mathrm{ft}(\mathrm{m}$ )
$h_{i}^{\prime} \quad=$ height above the base of the wall to the centre of gravity of the convective lateral force for the case including base pressure (EBP), $\mathrm{ft}(\mathrm{m})$
$\mathrm{h}_{\mathrm{r}} \quad=$ height above the base of the wall to the centre of gravity of the tank roof, ft (m)
$h_{w} \quad=$ height above the base of the wall to the centre of gravity of the tank shell, ft (m)
$\mathrm{H}_{\mathrm{L}} \quad=$ Design depth of stored liquid, Thes m ) Dissertations
$\mathrm{H}_{\mathrm{w}} \quad=$ Wall height (inside dimension), ft (m)
$=$ Importance factor, from Table 4.1.1 (a)
$\mathrm{m} \quad=$ Total mass per unit width of a rectangular wall $=\mathrm{mi}+\mathrm{mw}^{\prime} \mathrm{ib}-\mathrm{s} 2 / \mathrm{ft}$ per foot of wall width (kg per meter of wall width)
$\mathrm{m}_{\mathrm{i}} \quad=$ Impulsive mass of contained liquid per unit width of a rectangular tank wall, Ib-s2/ft per foot of wall width (kg per meter of wall width)
$\mathrm{m}_{w} \quad=$ Mass per unit width of a rectangular tank wall, $\mathrm{Ib}-\mathrm{s} 2 / \mathrm{ft}$ per foot of wall width (kg per meter of wall width)
$\mathrm{M}_{\mathrm{b}} \quad=$ Bending movement on the entire tank cross section just above the base of the tank wall, $\mathrm{ft}-\mathrm{Ib}$ ( $\mathrm{kN}-\mathrm{m}$ )
$\mathrm{M}_{\mathrm{c}} \quad=$ Bending movement on the entire tank cross section just above the base of the tank wall (FBP) due to the convective force Pc, ft -Ib
$\mathrm{M}_{\mathrm{c}}^{\prime} \quad=$ Overturning movement at the base of the tank, including the tank bottom and supporting structure (IBP), due to the convective force $\mathrm{Pc}, \mathrm{ft}-\mathrm{Ib}(\mathrm{kN}-\mathrm{m})$
$M_{i} \quad=$ Bending movement on the entire tank cross section just above the base of the tank wall (FBP) due to the convective force $\mathrm{Pc}, \mathrm{ft}-\mathrm{Ib}(\mathrm{kN}-\mathrm{m})$
$\mathrm{M}_{\mathrm{i}}^{\prime}=$ Overturning movement at the base of the tank, including the tank bottom and supporting structure (IBP), due to the convective force $\mathrm{Pc}, \mathrm{ft}-\mathrm{Ib}(\mathrm{kN}-\mathrm{m})$

| $\mathrm{M}_{0}$ | $=$ Overturning movement at the base of the tank, including the tank bottom and supporting structure (IBP), $\mathrm{ft}-\mathrm{Ib}(\mathrm{kN}-\mathrm{m})$ |
| :---: | :---: |
| $\mathrm{M}_{\mathrm{r}}$ | $=$ Bending movement on the entire tank cross section just above the base of the tank wall (FBP) due to the convective force $\mathrm{Pc}, \mathrm{ft}-\mathrm{Ib}(\mathrm{kN}-\mathrm{m})$ |
| $M_{w}$ | $=$ Bending movement on the entire tank cross section just above the base of the tank wall (FBP) due to the wall inertia force $\mathrm{Pw}^{\prime} \mathrm{ft}-\mathrm{Ib}(\mathrm{kN}-\mathrm{m})$ |
| $\mathrm{P}_{\mathrm{c}}$ | $=$ Total lateral convective force associated with Wc, $\mathrm{Ib}(\mathrm{kN})$ |
| $\mathrm{P}_{\mathrm{i}}$ | $=$ Total lateral impulsive force associated with Wi, Ib (kN) |
| $\mathrm{P}_{\mathrm{r}}$ | $=$ Lateral inertia force of the accelerating roof $\mathrm{Wr}, \mathrm{Ib}(\mathrm{kN})$ |
| Pw | $=$ Lateral inertia force of the accelerating wall $\mathrm{Ww}, \mathrm{Ib}(\mathrm{kN})$ |
| r | $=$ Inside radius of circular tank, ft (m) |
| R | $=$ Response modification factor, a numerical coefficient representing the combined effect of the structure's ductility, energy-dissipating capacity, and structural redundancy (Rc for the convective component of the accelerating liquid; Ri for the impulsive component) from Table 4.1.1 (b) |
| $\mathrm{W}_{\mathrm{c}}$ | $=$ Equivalent weight of the convective component of the stored liquid, $\mathrm{Ib}(\mathrm{kN})$ |
| $\mathrm{W}_{\mathrm{i}}$ | $=$ Equivalent weight of the implosive component of the stored liquid, $\mathrm{Ib}(\mathrm{kN})$ |
| $\mathrm{W}_{\mathrm{L}}$ | $=$ Total equivalent weight of the stored liquid, $\mathrm{Ib}(\mathrm{kN})$ |
| $\mathrm{W}_{\text {w }}$ |  |
| $\mathrm{Y}_{\mathrm{c}}$ | = Density el concrete, $1909 \mathrm{~m} / 73$ ( $\mathrm{kNN} / \mathrm{m} 3$ ) forstandard - weight concrete] |
| $Y_{L}$ | $=$ Density of contained liquid $1 \mathrm{~b} / \mathrm{ft} 3(\mathrm{kN} / \mathrm{m} 3)$ |
| $Y_{w}$ | $=$ Density of water, $62.43 \mathrm{Ib} / \mathrm{ft} 3(9.807 \mathrm{kN} / \mathrm{m} 3)$ |
| $\varepsilon$ | $=$ Effective mass coefficient (ratio of equivalent dynamic mass of the tank shell to its actual total mass), Eq (9-44) and (9-45) |
| $\theta$ | $=$ Polar coordinate angle, degree |
| $\omega_{\text {c }}$ | $\begin{aligned} & =\text { Circular frequency of oscillation of the first (convective) mode of shoeshine, } \\ & \text { radian/s } \end{aligned}$ |
| $\omega_{i}$ | $=$ Circular frequency of the impulsive mode of vibration, radian/s |
| SD1 | $=$ Design spectral response acceleration, $5 \%$ damped, at a period of 1 second as defined in 9.4.1, expressed as a fraction of the acceleration due to gravity $g$ |
| Tw | $=$ Average wall thickness, in, (mm) |
| Tc | $=$ Natural period of the forst (convective) mode of sloshing, s |
| Ti | $=$ Fundamental period of oscillation of the tank (plus the impulsive component of the contents), $s$ |
| Ts | $=S_{D 1} / S_{D S}$ |
