On the Application of Data Assimilation in Regional Coastal Models

DISSERTATION

Submitted in fulfilment of the requirements of
the Board for Doctorates of Delft University of Technology
and of the Academic Board of the International Institute for Infrastructural,
Hydraulic and Environmental Engineering for the Degree of DOCTOR
to be defended in public
on Monday, 8 February 1999 at 10:30 h

by

RAFAEL CAÑIZARES TORRE

born in Madrid, Spain

*Master of Engineering in Civil Engineering, Polytechnical University of Madrid
Master of Science in Hydraulic Engineering, International Institute for
Infrastructural Hydraulic and Environmental Engineering, Delft*

ABSTRACT

Data assimilation is a methodology which can optimise the extraction of reliable information from observations and combine it with, or assimilate it in, numerical models. The development of both the observation techniques and the numerical models (associated with the increase in computer speed and memory) has made of data assimilation a very important and attractive field within oceanography, meteorology and engineering.

This work deals with the integration and further development of existing computationally efficient data assimilation techniques for large scale regional coastal models. Two suboptimal schemes of the Kalman filter are described. The first scheme is a reduced rank square root (RRSQRT) approximation of the extended Kalman filter, which approximates the error covariance matrix by one of a lower rank. The second is the ensemble Kalman filter (EnKF), which calculates the error statistics using a Monte Carlo method. Both techniques can approximate the results obtained from the Kalman filter but at a much lower cost.

The performance of these methods is compared in a twin test using a two-dimensional shallow water equation model. The performance of the RRSQRT filter for forecasting and hindcasting has been tested in the standard two-dimensional model and in a special version that computes the shallow water equations in areas of different resolution (nesting). The final part of this work presents the initial tests of the implementation of the RRSQRT in a three-dimensional model.

Contents

1	Introduction	5
1.1	Data assimilation	6
1.2	Review of different data assimilation methods	6
1.2.1	Techniques from estimation theory	7
1.2.2	Techniques from control theory	9
1.3	Thesis outline	10
2	The Deterministic Hydrodynamic model	11
2.1	Introduction	11
2.2	The 2D shallow water equations model	11
2.2.1	Numerical Solution	13
2.3	Initial definition of the state vector in MIKE 21	14
2.4	The 3D shallow water equations model	14
2.4.1	Numerical solution	16
3	Kalman filter techniques	19
3.1	Linear filtering	19
3.1.1	Sequential updating algorithm	22
3.1.2	State vector augmentation: time coloured noise	22
3.2	Extended Kalman filter	23
3.3	The Reduced Rank Square Root filter	24
3.3.1	The RRSQRT algorithm	25
3.4	The Ensemble Kalman filter	27

3.4.1	The Ensemble Kalman filter scheme	28
3.5	Integration of a DA technique in MIKE21	30
3.5.1	Definition of the state vector	30
3.5.2	Measurements and measurement noise definition	31
3.5.3	The definition of the system noise	31
3.5.4	Scaling problem for a multivariate state vector	38
3.5.5	Memory reduction factor	39
4	Study and comparison: the RRSQRT filter and the EnKF	41
4.1	Definition of the true model and the observations	42
4.2	TEST 1: Errors in the open boundary conditions	42
4.2.1	Perfectly known statistics	44
4.2.2	Sensitivity and robustness	49
4.3	TEST 2: Error in the meteorological forcing terms	54
4.3.1	Perfectly known statistics	55
4.3.2	Sensitivity and robustness	59
4.4	Some remarks about the mass conservation problem	62
4.5	Conclusions	63
5	Application on a 2D hydrodynamic model. Test case	67
5.1	The North Sea model test case	67
5.1.1	The model set-up	67
5.1.2	Deterministic model performance	70
5.1.3	Filter set-up	73
5.1.4	Hindcast results	80
5.1.5	Forecast results	85
5.2	Conclusions	87
6	Application on a 2D Nested hydrodynamic model. Test case	89
6.1	Special features of the Nested model	89

6.2	Implementation of the RRSQRT filter	90
6.3	A test case: a regional model of the North sea and Baltic sea and a nested area in the Danish Inner waters	92
6.4	Conclusions	97
7	Initial tests on a 3D hydrostatic model	101
7.1	Implementation in MIKE 3 HDHS	101
7.2	Twin test	102
7.2.1	Test 1: Systematic error at the open boundary	103
7.2.2	Test 2: Systematic error at the meteorological forcing terms (No wind)	106
7.3	Conclusions	109
8	Summary and conclusions	111
	List of Figures	117
	List of Tables	121
	Bibliography	123
	Samenvatting (Summary in Dutch)	129
	Acknowledgements	131
	Curriculum Vitae	133
