## DECLARATION OF THE CANDIDATE AND SUPERVISORS

I declare that this is my own work and this dissertation does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

The above candidate has carried out research for the Masters dissertation under my supervision.

Dr. W. D. A. S. Rodrigo

29<sup>th</sup> May, 2015

## ACKNOWLEDGEMENTS

Foremost, I would like to express my sincere gratitude to my supervisor Dr. Asanka Rodrigo for the continuous support given for the research, for the patience, motivation, enthusiasm, and immense knowledge. His guidance helped me in all the time of research and writing of this dissertation.

Special thanks goes to Prof. Chintha Jayasinghe, Professor in Civil Engineering Department in University of Moratuwa for frequently reminding me about the submission date and encouraging me to finish my thesis on time.

My sincere thanks go to Mrs. Chulani Gamlath; a Chief Engineer in Ceylon Electricity Board, for enlightening me the first glance of research in year 2010. Also to Mr. L.D.J. Fernando, DGM (P&D) – DD4 and Mr. R.S. Wimalendra CE (P&D) – DD4 for the support gave me throughout the study.

Further, I must thank all the lecturers engaged in the MSc course sessions for making our vision broader, providing us with the opportunity to improve our knowledge in various fields.

University of Moratuwa, Sri Lanka.  
Electronic Theses & Dissertations  
[www.lib.mrt.ac.lk](http://www.lib.mrt.ac.lk)

It is a great pleasure to remember the kind cooperation of all my colleagues and my friends who have helped me in this Post Graduate programme by extending their support during the research period.

My special thanks go to my parents Mr. Nihal de Silva and Mrs. Chintha de Silva, and my sister Miss Santhrushika de Silva, for supporting me spiritually throughout my life and tolerating my engagement on this work.

P.H.N.S. de Silva

## ABSTRACT

In an era where Sri Lanka economy is going towards a drastically higher growth it is highly important to have a reliable electricity network in the country. To improve the reliability of the distribution network, Distribution Licensees improve the system capacity and at the same time install protective devices to reduce the interrupted area due to an electrical fault in the network. For this Auto Reclosers and Fuses are used in the Distribution Network.

In developed countries the installation of Protective devices are done optimally and techniques have been developed. In Sri Lanka, the process of planning, design and construction of transmission and medium voltage power lines is solely authoritative by Transmission Licensee and Five Distribution Licensees of the country. At present there is no proper way of selecting optimal location for the installation of Auto reclosers is practiced in either of these Licensees.

As the first step of this study, a research survey was done about the optimal location selection methods researched in other countries. A suitable objective function was modeled to find the optimal location to install an Auto Recloser with the constraint of finding two optimal locations in series.

University of Moratuwa, Sri Lanka  
Electronic Theses & Dissertations  
[www.lib.mrt.ac.lk](http://www.lib.mrt.ac.lk)

This report will discuss the objective function formation to find the optimal location for the Auto Recloser and also as a supporting study a pilot project done on how to co-ordinate the fuses with the Auto Reclosers and the Circuit Breakers at the Grid Substation is also included.

Major Findings of this research: Optimal locations to install an Auto recloser for a feeder according to the SAIDI values of substations and the energy consumptions of bulk and retail consumers connected to that specific feeder.

Findings of the pilot project: how to co-ordinate the fuses installed on a feeder and how to decide the rating of a fuse to be installed on the feeder by maintaining the protection co-ordination with other protective devices on the feeder.
