Abstract

In many countries the transportation planning process is currently turning from the unlimited expansion of the infrastructure to the improvement of the efficiency of the existing systems. This demands the development of efficient management tools. Due to the complexity of the problem, many of these tools are computer based models, a development which is reinforced by the explosion of computational power over the recent past.

This research is a development of a micro simulation model to understand delays at intersections. This would give an opportunity to traffic engineers to understand delays at intersections and to evaluate the effectiveness of traffic control measures before implementation. This information is very useful for situations where traffic signals are to be installed and the field trials would be expensive.

Even though there are a large number of variables that contribute to the intersection, three variables that would have considerable impact on intersection performance were selected for modelling. They are Geometric Properties, Vehicle Properties, and Driver Behaviour. Three different lane arrangements, five vehicle types and three driver behaviour situations can be handled by the model.

This model can be used to simulate both controlled and uncontrolled situations of four-way or three-way intersections. Validation of the model with field data was done using field surveys. Model outputs include queue length, vehicle flow, vehicle delay of each approach and graphical representation of vehicle movements.

J.

Acknowledgment

It is my desire to acknowledge my supervisor Professor J.M.S.J.Bandara for his constant encouragement and guidance at all stages of this research without whose invaluable commitment and dedication this research may not have been a reality. The valuable suggestions made by Prof. Amal S. Kumarage, Chairman, National Transport Commission, Dr. Ashok Peiris, Head, Department of Computer Science and Engineering, University of Moratuwa and Dr. Saman Thilakasiri, Senior Lecturer, Department of Civil Engineering, University of Moratuwa are also thankfully acknowledged.

A special thanks goes to the Asian Development Bank for providing financial support for this research through the Science and Technology personnel Development Project and the Director Postgraduate Studies, Dean Faculty of Engineering, Head of Civil Engineering Department, Research Coordinator, Department of Civil Engineering and all the academic staff members of the Department of Civil Engineering for providing the opportunity to complete this research. Dissertment

I extent my heartfelt gratitude to the Deputy Director (Planning) Mr. Gunathilaka Bandara and his staff of Road Development Authority for providing survey data for the research. The completion of the field survey was made possible due to the enthusiasm and support given by fellow researchers and staff members of the Transportation Engineering Division in the Department of Civil Engineering, especially Damith, Ravihansa, and Siva to whom a special thanks are due. I would like to thank all the staff members of the Transportation Engineering Division and the Computer Service Division in the Department of Civil Engineering for the assistance extended for this research.

Finally, a special thank you goes to Mr.& Mrs. Shanthi Jayakoddy, my dear friends Prabath & Pradeep, my family members for their constant encouragement and support, extended throughout the study, to make this research a reality.
