ABSTRACT

One of the major scourges accompanying water resource development in Sri Lanka is the explosive proliferation of water hyacinths (*Eichhornia crassipes*). A better sustainable solution to manage the infestations seems to be biological control and the main biological control agent used in many parts of the world including Sri Lanka is reported to be the weevil [(*Neochetina eichhorniae* Warner) (Coleoptera; Curculionidae)]. Fernando and Room used the weevil *N. eichhorniae* for the first time in Sri Lanka in 1988. Although some 15 years have elapsed since the first release, infestation in the areas in which the weevil was released is as high as in the areas in which *N.eichhorniae* was not released. The present study therefore focuses on the evaluation of the role of *N. eichhorniae* and *N.bruchi* on controlling water hyacinth and is designed to evaluate the optimum weevil densities required to cause significant damage to the plants. Healthy plants of height 21 cm \pm 1 were cultured in 6 and 4 fiberglass tanks respectively for a period of 8 weeks to complete one life cycle of weevil. Different weevil densities were used, varied from 1, 3, 6,10 and 15 weevils per plant, and the control with no weevils. In case of *N.bruchi* the first 3 treatment levels were tested with the control. Field monitoring carried out in eight locations within the Western province and showed the average maximum weevil density in natural conditions as 2 per plant. The success of biological control using *N.eichhorniae* will ultimately rely on host plant quality and the habitat conditions to establish a healthy population of weevil densities. Results showed that the treatments with weevil numbers less than 3 of *N.eichhorniae* per plant did not significantly change ($p>0.01$) the water hyacinth stands, but 3 weevils per plant of *N.bruchi* was the best option in sustainable management. Densities of 10 of *N.eichhorniae* and 6 of *N.bruchi* were subjected to complete eradication of the plant.

ACKNOWLEDGEMENT

First, I would pay my heartfelt gratitude to my supervisors, Dr. N. P. D. Gamage, Dr. M. W. Jayaweera and Dr. (Mrs) S.D. de Silva for guiding me in all aspects throughout the research. I wish to offer my cordial thanks to Professor (Mrs) N. Rathnayake, Director of Post Graduate Studies and to the Chancellor of University of Moratuwa, Dr. Ray Wijeywardena for their helping hands stretched out to me at turn.

Special thank are offered to Dr. I.V.S. Fernando and Dr. Lalith Gunasekera for their advise concerning this project.

It is with grateful appreciation that I acknowledge the contribution made by the Environmental Engineering Laboratory staff of the University of Moratuwa, namely Ms. Priyanka Dissanayake, Mrs. Nilanthi Gunathilake and Mr. Justin Silva by way of technical assistance.

I wish to offer my sincere thanks to my loving parents, my heartiest friend Akalanka and all the others including my friends, who supported and encouraged me in numerous ways to make my effort a success.

Finally I gratefully acknowledge funding from the Asian Development Bank and Saitama University, Japan for this project.

TABLE OF CONTENTS

	Page
List of figures	i
List of tables	ii
 Chapter 1: Introduction	
1.1 Water hyacinth – as a troublesome weed	1
1.2 Control strategies in Sri Lanka	2
1.3 Introduction to water hyacinth weevils	4
1.4 Scope of the study	7
1.4.1 Study objectives	8
 Chapter 2: Literature review	
2.1 Introduction	10
2.2 Water hyacinth	11
2.2.1 Description	11
2.2.2 Growth and life cycle	12
2.2.3 Distribution and habitat	13
2.2.4 Nature of damage	14
2.2.5 Utilization	16
2.3 Management of water hyacinth	16
2.3.1 Mechanical control	17

	Pages
2.3.2 Chemical control	17
2.3.3 Biological control	18
2.3.3.1 Exploration for natural enemies	19
2.3.3.2 Agents currently being studied	22
2.4 The water hyacinth weevils	22
2.5 Host range testing and results for <i>Neochetina</i> species	25
2.6 History of introduction	26
2.6.1 Case studies reported	26
Chapter 3: Methodology	
3.1 Field study-phase 1	30
3.2 Impact of <i>Neochetina eichhorniae</i> on host plant	31
3.3 Impact of <i>Neochetina bruchi</i> on host plant	34
3.4 Statistical analysis	35
Chapter 4: Results and Discussion	
4.1 Results of field study – phase 1	36
4.2 Impact of <i>Neochetina eichhorniae</i> density on host plant	39
4.2.1 Nature of damage	39

	Pages
4.2.2 Impact of <i>Neochetina eichhorniae</i> on plant growth	44
4.2.3 Impact of <i>Neochetina eichhorniae</i> on leaf dynamics	45
4.3 Impact of <i>Neochetina bruchi</i> density on host plant-phase III	47
4.3.1 Nature of the damage and impact on plant reproduction	47
4.3.2 Impact of <i>Neochetina bruchi</i> on plant growth	50
4.3.2 Impact of <i>Neochetina bruchi</i> on plant Leaf dynamics	50
4.4 Comparison of the effectiveness of the two weevils	52
4.5 Effect of weevil herbivory on plant N content	53

Chapter 5: Conclusion and Recommendations

5.1 Conclusion	55
5.2 Drawbacks of the study	56
5.3 Recommendations for future work	57

Appendix 1: Study sites in the field	a-b
