Declaration of the candidate

“I declare that this is my own work and this thesis/ dissertation does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any University or other institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text”

Signature: *UOM Verified Signature*

Date: 16.08.2014

Declaration of the supervisor

“I have supervised and accepted this thesis for the submission of the degree”

Signature of the supervisor: *UOM Verified Signature* Date: 16.08.2014.

Dedication

This thesis is dedicated to my parents for their love, endless support and encouragement

Acknowledgements

First and foremost, I would like to thank to my supervisor of this thesis, Mr. Dissanayake, A. R., for his valuable guidance and advice. Deepest gratitude is also due to Mr. Cooray, T. M. J. A., without whose great teaching of “Financial Time Series Analysis and Forecasting” course unit, this thesis would not have been successful. I also wish to express my gratitude to all academic and non academic staff members of department of Mathematics, who rendered their help during the period of my thesis work.

In addition, I would also like to thank Market Development Division of Colombo Stock Exchange (CSE) which provided me information for my thesis. Also, I would like to take this opportunity to thank to all previous researchers, whose articles/reports support me to carry on this thesis. Finally, an honorable mention goes to my family and friends for their understandings and supports on me in completing this thesis.

Abstract

Trading volume is one of the most favored proxies for information arrivals. This study investigated the empirical relationship between stock returns, trading volume and volatility for ordinary voting shares of 20 active companies with respect to banking, finance and insurance (BFI) sector in Colombo stock exchange (CSE) during the period from January 2004 to December 2011. The number of trades, the number of shares traded and the turnover were used as different measures of trading volume. This study followed the conventional methodologies used by Brailsford (1996) and Kumar and Singh (2010). The results indicated that a positive and significant correlation between absolute return and trading volume, irrespective of the direction of price change across all three measures of volume. Furthermore, evidence was found supporting the hypothesis that the volume-price change response slope for negative returns is smaller than the response slope for positive returns, thereby supporting an asymmetric relationship. Also, the study found a positive and significant relationship between trading volume and unconditional volatility, irrespective of the direction of price change and an asymmetric relationship between trading volume and unconditional volatility when the number of trades is taken as measure of volume. The vector autoregressive (VAR) model suggested that the information is processed sequentially rather than simultaneously on BFI sector in the CSE. Furthermore, the results of VAR model, Granger causality test, impulse response function and variance decomposition, indicated that in the presence of current and past volume, returns add some predictive power for future volume when the number of trades is taken as measure of volume. In case of trading volume and conditional volatility, the results support for a strong relationship between contemporaneous volume and conditional volatility. Furthermore, the results indicated that the inclusion of contemporaneous volume in the conditional variance equation of returns results a partially reduction of the volatility persistence. As there was no substantial reduction of volatility persistence, there was no strong evidence for the validity of mixture of distributions hypothesis (MDH) in respect of BFI sector in the CSE. Also, the results suggested that the number of trades is a better proxy for information arrivals than other two measures of volume.

Table of Contents
