

Energy Management for Optimal Renewable Energy Usage in an Apartment Building

G.R. Kodithuwakku

(159312C)

Dissertation submitted in partial fulfillment of the requirements for the

Degree Master of Science in Electrical Engineering

Department of Electrical Engineering

University of Moratuwa

Sri Lanka

December 2019

DECLARATION OF THE CANDIDATE & SUPERVISOR

I declare that this is my own work and this dissertation does not incorporate without acknowledgment any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgment is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

ABSTRACT

Common renewable energy plants with proper energy management for a selected community can bring immense benefits to its consumers compared to isolated/individual renewable energy (RE) systems. Optimal usage of RE within boundaries provide with less burden on transmission/distribution networks, reduced energy loss, improved power quality, and financial benefits for both investors and consumers. In this study, we recognize apartment buildings, housing schemes, zoning areas, universities and other such institutes as potential target sites to implement this concept.

Energy management of the proposed common renewable energy plant is done by considering shiftable loads. Shiftable loads/noncritical loads, such as washing machines, dryers, irons, thermal storage are able to provide scheduling flexibility to achieve a lower electricity bill under the integration of renewable energy. In Sri Lanka, under time of use tariff mechanism, electricity price vary thrice a day.. Since the amount of renewable energy generation is also varying throughout the day, based on the predictability of day-ahead weather conditions and with the cooperation of the consumers, an optimum load schedule can be identified for the shiftable loads.

This research proposes to develop an algorithm for day-ahead load scheduling in an apartment building with the aim of harvesting maximum renewable energy generation. The results show that the proposed algorithm schedules shiftable loads resulting in a significant reduction in the cost of electricity to the consumers. This concept will attract investors to the renewable energy industry by making immense extra revenues and quick payback periods. Moreover, this method adds an extra marketing point to sell apartments, which makes it beneficial for the building construction industry.

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to my supervisor Dr. Lidula N. Widanagama Arachchige and Dr. Asanka Rodrigo for their guidance and support from the very beginning to the end.

My sincere thank goes to all the lecturers who were involved in the evaluation process and for their constructive criticism to make this project a success.

Finally, I would express my heartiest gratitude to my family, for helping me complete this work under difficult circumstances.
