DECLARATION OF THE CANDIDATE AND SUPERVISOR

I declare that this is my own work and this dissertation does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis/dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

Date:.....

The above candidate has carried out research for the PhD thesis/ Dissertation under my supervision.

Signature of the supervisor:

Date :.....

Name of the supervisor: Prof(Mrs.) B.M.W.P.K Amarasinghe

Abstract

This thesis outlines the analysis of heat and mass transfer process of drying of black pepper in a spouted bed coupled with a cyclone separator. Black pepper is a widely used spice and is well-known for its pungency and aroma. Experiments conducted with wetted black pepper reveals that conventional spouted bed has the higher drying rate, higher moisture diffusivity, lower drying time and lower activation energy compared to those of spouted beds equipped with porous draft tube and non-porous draft tube. Therefore, the conventional spouted bed was used to conduct the experiments to achieve the objectives of the study since it was identified as the optimum configuration of the spouted bed.

Spouting behaviour of raw black pepper was studied in the conventional spouted bed. The minimum spouting velocities of particular bed heights at ambient temperature were determined. Minimum spouting velocity of raw black pepper in the conventional spouted bed versus static bed height was correlated to a power form of function and the exponent of static bed height was 0.67. The effect of operational conditions; drying air temperature, air velocity and static bed height on drying kinetics of raw black pepper was analysed. The higher values of moisture removal rates were achieved when the dryer was operated with moderately high air temperatures, high air flow rates and shallow beds. Drying kinetic data of raw black pepper in the conventional spouted bed shows only falling rate periods. Effective moisture diffusivity values increased with increasing drying air temperature. The highest effective moisture diffusivity of $2.03 \times 10^{-10} \text{ m}^2/\text{s}$ was obtained at air temperature of 75°C . Activation energy for drying of raw black pepper in conventional spouted bed was 38.59 kJ/kmol . Specific energy consumption was calculated and the specific energy consumption values increased with increasing air velocity and decreased gradually with increasing the static bed height.

Drying kinetic data obtained from experiments were fitted to five thin layer drying models. Results show that the Logarithmic model gives the best fit. In addition, four models were developed for black pepper drying in the conventional spouted bed by correlating drying constants and coefficients of Logarithmic model to stagnant bed height at specified temperatures; 45°C , 55°C , 65°C , and 75°C . Developed models can be used to estimate the drying time of black pepper in the conventional spouted bed dryer for given moisture reduction in the ranges of 0.14-0.22 m stagnant bed heights and in 2.37 m/s air velocity at specified temperatures.

Essential oil was extracted using hydro distillation from black pepper dried at five different drying conditions. The analysis of components by Gas Chromatography Mass Spectrometry technique shows that the black pepper essential oil comprised mainly monoterpenes and sesquiterpenes. Analysis of variance was conducted and the results show that variation of sesquiterpenes concentration in black pepper essential oil was significant while variations of monoterpenes, oxygenated terpenes and caryophyllene concentration were non-significant in black pepper essential oil with drying air temperature. In addition, the variation of essential oil yield is statistically significant with drying air temperatures. 65°C drying air temperature provides consistent quality essential oil with high percentage of caryophyllene and higher oil yield.

Heat transfer coefficients for black pepper drying in the conventional spouted dryer were estimated for different drying conditions of unsteady state drying of black pepper dried from initial moisture content to final moisture content of 15% dry basis. Heat transfer coefficient varied from $35\text{-}68 \text{ W/m}^2\text{K}$ for the conditions under the investigation. Dimensional analysis

was carried out and important dimensionless numbers were identified. A correlation was developed for heat transfer process as a function of dimensionless groups namely Reynolds number, Nusselt number, Gukhman number and static bed height to particle diameter with 0.791 of coefficient of determination. Heat transfer coefficients predicted from the developed correlation show a good agreement with the experimentally determined heat transfer coefficients.

Keywords: Black pepper, spouted bed, drying kinetics, heat and mass transfer, essential oil

ACKNOWLEDGEMENT

It is my pleasure to extend sincere appreciation to all who rendered support in numerous ways to make my research a success.

First and foremost, I wish to express my sincere gratitude and respect to my supervisor, Prof. (Mrs) B.M.W.P.K Amarasinghe, Department of Chemical & Process Engineering, University of Moratuwa, for the excellent guidance throughout my postgraduate study period in many ways. Her dedication, patience, knowledge and experience inspired me to become an independent researcher and helped me realise the power of critical thinking.

I am also grateful to Prof. A.D.U.S Amarasinghe for all the advice and encouragement that he gave me throughout the time as one of progress review committee member. Then I must offer my sincere thanks to Prof. P.G Rathnasiri, Dr.(Ms). M. Y Gunsekara and Dr. Marliya Ismail for the valuable comments given, as my progress review committee members.

Prof. S. Walpalage, Prof. P.G Rathnasiri and Dr. S Gunawardhena who were the Head of the Chemical & Process Engineering Department throughout the period and all the lecturers of the Department of Chemical & Process Engineering, University of Moratuwa, who helped me in various ways to complete this research successfully, must be specially mentioned.

I am also grateful to the HETC project of Ministry of higher education for providing me the research funding and Post Graduate Studies Division, University of Moratuwa for approving my research project. I am grateful for the broad range of service provided by library of University of Moratuwa. I would like to extend my sincere gratitude to Institute of Technology University of Moratuwa for granting study leave and vacation leave to complete the research work and nominating me for HETC/HRD scholarship.

Also my sincere tanks due to Ms. Nilanthi Fonseka, former Head; Division of Polymer, Textile and Chemical Engineering Technology Institute of Technology University of Moratuwa.

I am also very much grateful to Ms. Dinusha Martino; analytical chemist, Mr. Chinathka Narangoda; system analyst and Ms. K L Chandrasiri for the valuable help and support given for my research. Mrs. H.B.R Sajeewani, Mrs.I.K Athukorala, Mr. J.Wijesinghe, Mr. D. Senarath Epa, Mrs. W.K.I. Gayani , Mrs. W.S.M De Silva and all the staff members of Particulate Engineering Laboratory, Energy Engineering, Industrial Chemistry, Polymer Engineering, Food & Microbiology laboratories of Department of Chemical & Process Engineering, University of Moratuwa are reminded with heartfelt of thanks for their support given me in various occasions.

I would like to extend my thank to my sister and Dr. Duleeka Gunarathna and Anushka Perera for providing valuable literature during my research period. Furthermore, special thanks to Mr. Upali Jayasekara Managing Director of Mega Heaters (Pvt) Ltd and his staff members for carefully and patiently constructing the experiment set up.

I would be thankful to all my colleagues Ms. Thamali Wijewickrama, Ms. Bagya Herath, Ms. Sachini Thilakerathna, Ms. Sureshini, Ms.Wathsala Wickramaarchchi, Mr. Janith Bandara, Mr. Chamila Wickramasinghe, Mr. Kaun Senarathna, Mr. Nuditha Dilnayana, Ms. Imesha Samarathunga, Ms. Iroshini Kumarage and Ms. Daham Shyamalee who were with me and gave the best support by making the research period pleasant and enjoyable.

Finally to my husband, my parents in low, my parents and my sisters who have been my side through this journey. My PhD dream became a reality through their commitment and sacrifice. Also, without my house-maid Rita whom with us for four years, this dissertation would never been possible with my little baby Nethuli and my son Senuja.

Figure 7.9: Nusselt number as a function of static bed height for black pepper dried in conventional spouted bed of different bed heights; Experiment conditions: $D_i=0.05$ m, $T_{gi}=65$ °C and $U=2.37$ m/s.....	162
Figure 7.10: Response surfaces for predicted Nu number as a function of Gu number and Re number at different static bed heights.....	163
Figure 7.11- Effect of air velocity and Re number on heat transfer coefficient for black pepper dried in conventional spouted bed at different superficial air velocities; Experiment conditions: $D_i=0.05$ m, $T_{gi}=65$ °C and $H=0.14$ m.....	164
Figure 7.12-: Nusselt number as a function of Reynolds number and air velocity for black pepper dried in conventional spouted bed at different superficial air velocities; Experiment conditions: $D_i=0.05$ m, $T_{gi}=65$ °C and $H=0.14$ m.....	165
Figure 7.13: Response surfaces for predicted Nu number as a function of Gu number and H/d_p at different air velocities.	165

LIST OF TABLES

Table 2.1:Correlations for minimum spouting velocity.....	19
Table 2.2 : Correlation associated with heat transfer in spouted beds.....	24
Table 2.3:Thin layer drying models.....	28
Table 3.1: Geometric factors of the spouted bed.....	41
Table 3.2: Dimensions of non-porous draft tubes.....	44
Table 3.3: Dimensions of porous draft tubes.....	44
Table 3.4: Operating conditions of preliminary experiments conducted to analyze the effect of spouted bed configuration at minimum spouting air velocity.....	46
Table 3.5: Operating conditions of preliminary experiments conducted to analyze the effect of spouted bed configuration at superficial velocity of 0.89 m/s.....	46
Table 3.6: Operating conditions of preliminary experiments conducted to analyze the effective moisture diffusivity of black pepper in three spouted bed configuration ...	47
Table 3.7 : The conditions used in drying experiments with conventional spouted bed.....	54
Table 3.8: Important variables for heat transfer of black pepper in the spouted bed dryer.....	59
Table 3.9: Selected thin layer drying models used for analysis.....	61
Table 4.1: Minimum spouting velocity.....	67
Table 4.2: Drying time of black pepper at different spouted bed configurations at different air velocities.....	76
Table 4.3: Drying time of spouted bed configurations at different drying temperatures.....	78
Table 4.4: Effective moisture diffusivity of wetted black pepper dried in conventional spouted bed at different temperatures.....	85
Table 4.5: Effective moisture diffusivity of wetted black pepper dried in porous draft tube fitted spouted bed at different temperatures.....	85
Table 4. 6: Effective moisture diffusivity of wetted black pepper dried in non-porous draft tube fitted spouted bed at different temperatures.....	86
Table 4.7: Pre -exponential factor and activation energy of wetted black pepper dried in different spouted bed configurations.....	87
Table 4.8: Results of statistical analysis for three spouted bed configurations at 55_°C drying air temperature.....	90
Table 4.9: Results of statistical analysis for three spouted bed configurations at 65_°C drying air temperature.....	91
Table 4.10: Results of statistical analysis for three spouted bed configurations at 75_°C drying air temperature.....	92
Table 5.1: Experimental and predicted minimum spouting velocity for selected stagnant bed heights of raw black pepper.....	103
Table 5. 2- Experimental and predicted maximum pressure drop for selected stagnant bed heights of raw black pepper.....	103

Table 5.3: Drying time and volume of air required for raw black pepper when dried in conventional spouted bed at different drying air temperatures. Experiment conditions: $D_i=0.05$ m, $H=0.14$ m (bed weight = 1 kg), and air flow of 2.37 m/s..	106
Table 5.4: Volume of air required for raw black pepper when dried in conventional spouted bed at different static bed heights; experiment conditions: $D_i=0.05$ m, $T_d=65$ °C and air flow of 2.37 m/s	110
Table 5.5 : Drying time and volume of air required for raw black pepper when dried in conventional spouted bed dryer at different superficial air velocities; Experiment conditions: $D_i=0.05$ m, $T_d=65$ °C and $H=0.14$ m	113
Table 5.6: Specific energy consumption for drying of black pepper at different drying temperatures (air velocity 2.37 m/s)	116
Table 5.7 : Effective moisture diffusivity of raw black pepper dried in conventional spouted bed dryer at different temperatures	119
Table 5.8: Newton model developed for black pepper drying in conventional spouted bed for various stagnant bed heights and drying air temperatures at 2.37 m/s of air velocity	121
Table 5.9: Page's model developed for black pepper drying in conventional spouted bed for various stagnant bed heights and drying air temperatures at 2.37 m/s of air velocity	122
Table 5.10: Henderson and Pabis model developed for black pepper drying in conventional spouted bed for various stagnant bed heights and drying air temperatures at 2.37 m/s of air velocity	123
Table 5. 11: Two compartment model developed for black pepper drying in conventional spouted bed for various stagnant bed heights and drying air temperatures at 2.37 m/s of air velocity	124
Table 5. 12: Logarithmic model developed for black pepper drying in conventional spouted bed for various stagnant bed heights and drying air temperatures at 2.37 m/s of air velocity	126
Table 5. 13: The results of the multiple regressions on the coefficients and constants of the logarithmic model for the effects of the stagnant bed height.....	130
Table 5. 14: Modified Logarithmic model for black pepper drying for 45 °C - 75 °C	131
Table 6.1: Constituents of essential oil extracted from black pepper dried under different drying conditions	140
Table 6.2: Ten Most Abundant Components of Black Pepper Essential Oil.....	141
Table 7.1: Dimensional matrix of the fundamental dimensions related to heat transfer process.....	148
Table 7.2: Operating conditions, heat transfer coefficient for black pepper dried in conventional spouted bed.....	153

LIST OF FIGURES IN APPENDICES

Appendix A Figure 1: Powder classification diagram for fluidization by air at ambient conditions [12].....	186
Appendix B Figure 1: Precision balance; VWRECN 611-2300.....	195
Appendix B Figure 2: Portable digital balance; KERN PCB 350-3	195
Appendix B Figure 3: Drying Oven; A lab Tech LDO-060E.....	195
Appendix B Figure 4: EXTECH CFM Thermo anemometer model 407113; (b)-Thermo-Hygrometer Model GMK-920HT	196
Appendix B Figure 5: GC-MS)-7890A gas chromatograph (Agilent, American) equipped with a 5975C plus mass spectrometer (Agilent, American).....	196
Appendix C Figure 1: Spouted bed column.....	197
Appendix C Figure 2: non porous draft tube	198
Appendix C Figure 3: Reverse flow cyclone separator	198
Appendix C Figure 4: Arrangement of temperature sensors	199
Appendix G Figure 1 : Model for heat transfer.....	302
Appendix G Figure 2: Model for heat transfer.....	302

LIST OF TABLES IN APPENDICES

Appendix A Table 1 : Brief description of widely used dryers	183
Appendix A Table 2: Categorization of powders in relation of fluidization characteristics [12]	186
Appendix A Table 3: Some of the key characteristics of gas spouted and gas fluidized bed dryers.....	187
Appendix A Table 4: Characteristics of the conventional spouted bed versus spouted bed with draft tubes	188
Appendix A Table 5: Correlation for Minimum Spouting Velocity.....	189
Appendix A Table 6: Correlations available for prediction of maximum spoutable height.....	190
Appendix A Table 7: Correlation available for prediction of maximum pressure drop	191
Appendix A Table 8: Options for scaling up of conventional spouted bed	192
Appendix A Table 9: Specifications of black pepper defined by some institutes. ..	193
Appendix A Table 10: Standard quality specifications of black pepper approved by Sri Lanka Standard Institute.....	193
Appendix C Table 1: dimensions of cyclone separator	198
Appendix E Table 1: Mean composition of essential oil derived from black pepper dried at different conditions	282
Appendix E Table 2: Percentage of Constituents of essential oil extracted from black pepper dried at different drying conditions	292
Appendix E Table 3: Information of five most abundant sesquiterpene in black pepper essential oil under investigation [120]	293
Appendix E Table 4: Information of six most abundant monoterpene in black pepper essential oil under investigation [120]	294
Appendix E Table 5: ANOVA table for comparative study of sesquiterpenes, monoterpenes and oxygenated terpenes with drying temperature	295
Appendix E Table 6: ANOVA table for Caryophyllene with drying temperature ..	295
Appendix E Table 7: ANOVA table for oil yield vs. drying temperature	296
Appendix F Table 1: Operating conditions, heat transfer coefficient, important non-dimensional numbers of heat transfer process of black pepper drying in conventional spouted bed.	297
Appendix G Table 1: Summary of model for heat transfer	301
Appendix G Table 2: ANOVA Table for model for heat transfer	301
Appendix G Table 3: Coefficients for model for heat transfer	301

LIST OF ABBREVIATIONS

ANOVA - Analysis of Variance

ASTA - American spice trade association

CFD - computational fluid dynamics

CSA - Canadian spice association

CSB - conventional spouted bed

ESA - Europe spice association

GC-MS - Gas Chromatography Mass Spectrometry

MR – Moisture ratio

NCPHT & VA - National Committee on Post-Harvest Technology and Value Addition

R^2 - Coefficient of determination

RMSE - Root mean square error

SBNPDT - Spouted bed equipped with non-porous draft tube

SBPDT - Spouted bed equipped with porous draft tube

SEC - Specific energy consumption

SLCARP - "Sri Lanka Council for Agricultural Research Policy"

SSE - Sum of square error

VSD - variable speed drive
