

# Intelligent Collaboration among Robotic Agents for Landmine Detection

VAITHILINGAM KUMARATHASAN

This thesis was submitted to the department of Electrical Engineering of  
University of Moratuwa in partial fulfillment of the requirements for the

Degree of Master in Science  
University of Moratuwa, Sri Lanka.  
Electronic Theses & Dissertations  
[www.lib.mrt.ac.lk](http://www.lib.mrt.ac.lk)

Department of Electrical Engineering  
University of Moratuwa  
Sri Lanka

November 2004

Supervisor: Thrishantha Nanayakkara PhD

# Declaration

---

The work submitted in this thesis is the result of my own investigations, except where stated.

It has not already been accepted in substance for any degree, and also not being concurrently submitted for any other degrees.

V. Kumarathasan  
Candidate

# Abstract

---

Landmines remain as a significant barrier to economic and social development for more than sixty countries including Sri Lanka. Once a conflict comes to an end, the areas where landmines have been laid have to be cleared for human re-settlement. Demining is an operation accompanied with a lot of risk to human deminers. Analysis of the actions of the human deminers shows that some of them could be more easily and safely performed by robotic systems. From this perspective these robotic systems appear to have an important role to play in finding and removing millions of landmines from around the world.

This thesis proposes a novel algorithm for multi-robot collaboration for landmine search operations. The challenge is to enable robots to work together in an intelligent manner to detect landmines as fast as possible. Collaboration among robots is based on a decentralized approach in which robots are based on a set of behaviors; such behaviors are designed to increase global performance and are based in local information and shared information from other team members whenever they are within the range of communication. Landmine search method is improved using the prior knowledge about landmine field.

The effectiveness of the algorithm is demonstrated using extensive simulation studies. Result shows that collaboration of robotic agents and use of information about mine fields reduces the landmines search time dramatically.

# Acknowledgements

---

I would like to thank my supervisor, Dr. Thrishantha Nanayakkara for his guidance throughout the project. He has provided me with invaluable advice on which direction my project should take and what I should focus on. He has made it a point to visit the students working in the laboratory and see if we have any problems.

I convey my humble gratitude to Dr Nalin Wickramarachchi and Dr. Nishantha Nanayakkara for their valuable comments and suggestions. I also thank the progress review panel Prof H. Sriyananatha, Dr. HYR Perera and Dr L Udawatta for their suggestions to improve my work.

My deep, respectful gratitude goes to ADB and NSF for funding the project and special thanks go to Prof (Mrs.) N. Ratnayake, who made tremendous effort to award ADB scholarship. I also thank Dr. R. G. N. De. S. Munasinghe, Director, Postgraduate studies and his staff for the support and guidance given to me.

My sincere thank goes to Prof JR Lucas, former head of the department and Dr. Ranjith Perera, present head of the department for their valuable guidance and the support given to me during difficulties. I also thank the technical officers from the department for their support given to me.

I would also like to thank my peers, Ampikathan Aravinthan and Visvakumar Aravinthan for their insightful comments and help. They have provided a different perspective for solving the problems I faced.

Last but not least I thank my parents for their support to lift me whenever I underwent difficulties and for their love
