DECLARATION OF THE CANDIDATE AND SUPERVISOR

“I declare that this is my own work and this thesis does not incorporate without acknowledgement any material previously submitted for a Degree or Diploma in any other University or institute of higher learning and to the best of my knowledge and belief it does not contain any material previously published or written by another person except where the acknowledgement is made in the text”.

Also, I hereby grant to University of Moratuwa the non-exclusive right to reproduce and distribute my thesis/dissertation, in whole or in part in print, electronic or other medium. I retain the right to use this content in whole or part in future works (such as articles or books).

ABSTRACT

Flood Risk Assessment in Kalu River Basin in Sri Lanka using Geospatial Techniques and Hydrological Modelling

Kalu Ganga basin is one of the main waterway basins in Sri Lanka which gets exceptionally high rainfalls with higher discharges. This report is about how the different zones, having a higher likelihood of a flood in the Kalu Ganga basin can be identified through remote sensing and geospatial approach. RRI model was additionally used to get the flood extents to verify the flood susceptibility map. Six flood influencing parameters (elevation, slope, land use, flow accumulation, soil, and rainfall) were taken for obtaining a flood susceptibility map with the AHP method in ArcMap. In the RRI model, the built-in data (Flow Direction, Flow Accumulation, DEM, Soil, and Land Cover) with observed rainfall data was used for generating a flood inundation map. The flood susceptibility map has a flood susceptibility area under the Very High category of 267 km² (8.4%) in the Kalu Ganga basin which is the most probable flood occurrence area. The flood inundation maps of May 2003, April 2008, and May 2008 have an area of 217.9 km² (6.3%), 193.6 km² (5.6%), and 108.5 km² (3.1%), respectively with flood depths greater than or equivalent to 1 meter in Kalu Ganga basin where the flood depths greater than or equivalent to 1 meter cover all the flood depths. In the AHP method, the rainfall parameter greatly influenced the flood susceptibility map. The built-in data with *nr* river value and *ns* slope values greatly influence the flood inundation map in the RRI model. The flood susceptibility map from the AHP method in ArcMap has a higher flood potential area than the flood inundation map obtained from the RRI model, and this is because the simulated or observed flood maps are always a subset of the flood susceptibility map. The flood susceptibility map obtained from the AHP method in ArcMap is a flood probability map and the flood inundation map from the RRI model is a simulated flood map. Therefore, they are different. However, the flood inundation area occurs within the flood susceptibility map. The Analytical Hierarchy Process (AHP) method is an alternative quick method of identifying flood potential areas and it can be applied to any other place around the world for the prevention and management of flood hazards.

Keywords: Analytical Hierarchy Process (AHP), Flood Mapping, Flood Risk Analysis, Rainfall-Runoff-Inundation (RRI) Model

DEDICATION

This thesis is dedicated to my father R.B. Gurung and my mother Sumitra Gurung who have been the source of inspiration and gave me moral support to proceed with my higher studies.

To my brothers Robin Gurung, C.K. Gurung, and Nirmal Gurung for giving me advice and encouragement to finish my thesis. To my sister in laws Daw Dem and Tshering Zam who gave me emotional support throughout my research. To my nephews Keldhen Gurung and Gesyel Mipham Wangyel for showering me with love and happiness.

And last but not the least, I dedicate this book to almighty god, thank you for the strength, happiness, and for giving me a healthy life. All of these, I offer to you

.

ACKNOWLEDGEMENTS

I want to pass on my true appreciation to my research supervisor, Dr. Nimal Wijayaratna for his nonstop help stretched out during the research, for his patience and guidance. Without his devoted oversight and consistent direction, this research would not have been a triumph. I am exceptionally thankful to him for his important time with me towards finishing this research.

I would like to convey my sincere gratitude to the Centre Chairman, Professor R.L.H.L Rajapakse for stretching out all the assistance to make the progress of this program. His guidance, help, and support amidst his busy schedule are greatly appreciated.

I would also like to thank Late Shri Madanjeet Singh, the Founder of SAF-Madanjeet Singh Scholarship, South Asia Foundation (SAF), the University of Moratuwa, and Organization for Youth Empowerment (SAF Bhutan Chapter) for giving me this opportunity to join this study towards a master's degree of Water Resource Engineering and Management, at UNESCO Madanjeet Singh Centre for South Asia Water Management (UMCSAWM), Department of Civil Engineering, University of Moratuwa, Sri Lanka.

My appreciation is additionally reached out to Miss Gunjan Kour, Miss Tina Sultana, Mr. Utsab Phuyal, Mr. Virendra Kumar, and Mr. Farid Farhat who gave me support to do the research successfully is greatly appreciated.
