Gayan Dasanayake

This dissertation was submitted to the Department of  
Computer Science and Engineering of the University of  
Moratuwa in partial fulfillment of the requirement for the  
Degree of MSc in Computer Science.

Department of Computer Science and Engineering  
University of Moratuwa  
Sri Lanka

October, 2007

## Declaration

I hereby declare that the work included in this dissertation has not been submitted in part or whole for any other academic qualification at any institution.

## Abstract

Over the past years programming languages have evolved from machine languages to assembly language and to high level languages. All this time the development abstraction has steadily moved up towards the domain. Today through Domain Driven Development (DDD) the application developer significantly benefits from the ease of application creation and maintenance. Thus DDD has become a very promising new area of research.

However in DDD more information is needed in the domain model and more effort is needed in the subsequent transformation to the other end. The model needs to capture and represent all the necessary information of the business solution and the transformation should transform it to the target feature rich IT solution. This concept of “programming” at the domain level fundamentally differs from mere code generation. The focus here is on creating complete, readily executable applications from the model.

This paper presents a framework and methodology for rich web application development based on the domain model. This includes a UML profile for web application modeling, XMI based model serialization, model transformation logic utilizing XSLT/XPath, a web application utilizing a component based web framework with a wide range of emerging technologies and a tool as proof-of-concept which can effectively be used for domain driven web application development.

## Acknowledgments

This thesis is the result of a research project carried out with the invaluable assistance of many people for whom I must be thankful.

Firstly, I wish to express my sincere thanks to my supervisor Mr. Chandika Mendis who gave me this very interesting research project idea, and also gave me invaluable knowledge in this area. The support and guidance he gave especially on “where to look” in a huge world of tools and technologies was imperative to the success of the project.

My earnest thanks go to Dr. Sanath Jayasena for the support he gave. If it wasn't for the continuous motivation he gave to all of us to do the project, it would have been impossible to finish the project in time.

I must also be thankful for my employer IFS R&D International Pvt Ltd for granting me adequate leave for me to attend to the research.

Finally, I wish to thank all my MSc batch mates who gave ideas and their views on my project which was also extremely helpful.

Thank you all!
